1.0 INTRODUCTION

The use of wood in modern society can be seen everywhere. From furniture to construction, from packaging to tissue paper and newsprint – wood products play a vital and integral part in our lives. Wood from well-managed forests is a renewable resource that will meet society’s economic, social and cultural needs without compromising the environment.

In New Zealand, the primary source of wood is from exotic plantation forests. Hancock Forest Management New Zealand Ltd (HFM NZ) is currently New Zealand’s largest plantation forest manager with forests located in the Northland, Central North Island and Bay of Plenty regions.

This document is intended to provide HFM NZ stakeholders with an overview of how we manage our forests and operations taking into account environmental, economic, social and cultural factors.

2.0 OVERVIEW OF HFM NZ

2.1 Estate Description

HFM NZ manages approximately 206,000 hectares of land in New Zealand on behalf of two forest investment entities:

- Tiaki Plantations Company
- Taumata Plantations Limited

The productive areas of each of the forest entities managed by HFM NZ are provided in the following table.

<table>
<thead>
<tr>
<th>Forest Owner</th>
<th>Area</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tiaki Plantations Company</td>
<td>22,470 ha</td>
</tr>
<tr>
<td>Taumata Plantations Ltd</td>
<td>183,300 ha</td>
</tr>
<tr>
<td>Total</td>
<td>205,770 ha</td>
</tr>
</tbody>
</table>

Tiaki Plantations Company has been under the management of HFM NZ since 2004 when Tiaki Plantations Company purchased forests from Kiwi Forests Group. Tiaki Plantations Company’s two largest forests are Tarawera and Matahina immediately to the south of Kawerau, with the balance of the estate comprising a number of smaller blocks in the Bay of Plenty, predominantly east of Rotorua. With the exception of one joint venture arrangement, the Tiaki forests are forestry rights for one rotation only. As the land is harvested, it is returned to the landowners who have various tenure arrangements for the next crop of trees.

Taumata Plantations Limited’s forests were purchased from Carter Holt Harvey Forests in December 2006 and have been under the management of HFM NZ since that date. The forests are all located in the North Island and include:

- Northern Region forests located from the far northern tip of the North Island down to Waipu Forest on the Brynderwyn Range. The forests are a combination of freehold and leasehold forests, including a substantial area of forest on land leased from Maori trusts and incorporations.
- Woodhill Forest west of Auckland located on land now owned by Ngāti Whātua o Kaipara after resolution of Treaty of Waitangi Claims in 2013. Taumata owns the current crop of trees on the land, with the land handed back to the landowner following harvest.
- Central Region is a cluster of forests in the Central North Island, the most significant of which is Kinleith Forest located in the South Waikato and Taupo Districts made up of a significant area of freehold land along with single rotation forestry rights, Crown lease and Maori lease blocks. The remainder of Central Region is made up of a range of smaller forests located in the King Country (predominantly Ruapehu and Waitomo Districts) and three smaller blocks located at Aotea and Aramiro. Forest tenure includes freehold, leasehold and forestry right blocks.
- Eastern Region comprises 9 Maori lease blocks located along the Eastern Bay of Plenty coast from Opotiki to East Cape.

The majority (98%) of the planted forest area is established in radiata pine (*Pinus radiata*) with the remainder largely in Douglas-fir (*Pseudotsuga menziesii*) and *Eucalyptus* species. The current annual harvest of the estate is approximately 4.4 million cubic metres of largely radiata pine.

HFM NZ also manages approximately 28,000 hectares of protected indigenous reserve areas within the forest estate.

### 2.2 HFM NZ Offices

HFM NZ has four offices which include:
- Head office in Tauranga
- Northern Area office located in Whangarei from which the Taumata Northern forests, including Woodhill Forest, are managed.
- Central Area office located in Tokoroa from which the Taumata Central forests are managed.
- Eastern Area office in Rotorua from which the Tiaki and Taumata Eastern forests are managed.

Maps of the HFM NZ managed estate are provided in Appendix I. Contact details for each of the HFM NZ offices are provided on page 42 of this document.

### 2.3 Management Objectives

HFM NZ's primary objective is to return value to the owners of the forests it manages through the development, management and harvesting of productive and high quality forests in a safe and sustainable manner.

HFM NZ seeks to achieve its objective through innovative business strategies, proactive management of natural and physical resources and building strong relationships with all stakeholders.

HFM NZ has a strong commitment to managing the land the trees are growing on for our clients, stakeholders and surrounding communities to ensure the long-term sustainability of our forests under management.
HFM NZ actively manages its responsibilities in the areas of biodiversity, soil and waterways protection, reserve management, recreation and public access and protection of historically significant sites within the forest estate.

The following is a summary of the key objectives of HFM NZ.

**Forest Management Objectives**
- Manage the forest estate as a renewable and sustainable resource
- Practise silviculture consistent with best management practice and the maximisation of return to the forest owner
- Monitor tree breeding to provide the most appropriate stock for the forests
- Harvest trees as close as possible to the most economically effective age
- Proactively manage risks to forest health such as fire, pests and disease
- Create employment and contracting opportunities for members of local communities and lease partners, within the constraints of meeting other performance criteria

**Health and Safety Objectives**
- Maintain a safe and healthy workplace free of injuries
- Develop a workplace culture where health and safety of all people is an overriding priority
- Promote collective and individual responsibility for health and safety
- Ensure that all staff and contractors are trained and competent to undertake their jobs safely
- Manage the state in compliance with the Health and Safety at Work Act 2015

**Stewardship Objectives**
- Manage the estate in compliance with relevant legislation, including the Resource Management Act 1991 and Heritage NZ Pouhere Taonga Act 2014
- Manage the estate in accordance with the NZ Forest Accord (1991) and the Principles for Commercial Plantation Forest Management in NZ (1995)
- Manage the estate in accordance with the requirements of voluntary certification systems to which HFM NZ is certified – FSC ® (Forest Stewardship Council) and in future PEFC (Programme for the Endorsement of Forest Certification)
- Identify and take into account environmental and social values when planning and undertaking operations to minimise negative impacts on the environment and the community
- Identify and protect areas of significant ecological and scientific value within our managed forests and put in place processes to protect and enhance identified values
- Manage our forests sustainably and minimise adverse effects of forest operations on soil and water values
- Minimise impact of operations on archaeological and cultural sites
- Minimise impact of operations on amenity values (visual, noise and air effects) and neighbouring properties
- Manage and use herbicides responsibly and seek to minimise the use of herbicides in our operations as far as practical
- Capture and learn from environmental incidents through incident reporting, investigation and sharing of learnings
- Ensure staff and contractors receive appropriate training to comply with the law and the requirements of the company Environmental Management System (EMS)
- Monitor environmental outcomes and research new ways to minimise impacts of forestry operations on the environment, and maximise environmental benefits of forests
- Recognise the recreational value of the forest estate to local communities and the general public and proactively manage public access taking into account the health and safety of people and environmental impacts
- Identify areas within our estate that meet the definition of High Conservation Value (HCV), Significant Natural Areas (SNA’s) and Significant Biodiversity Values, and manage these in accordance with relevant regulatory and certification requirements

Tarawera River, Tarawera Forest, Tiaki Plantations Company estate
2.4 FSC (Forest Stewardship Council) Certification

HFM NZ’s operations in New Zealand have been continuously certified by FSC since 2004.

FSC is an independent not for profit organisation headquartered in Germany, founded to promote the responsible management of the world’s forests. FSC certification is a means by which our investors, customers and other stakeholders can be confident that we are conducting our business legally responsibly and sustainably.

All forests certified by FSC must comply with an international set of rules called the ‘Principles and Criteria’. The requirements of FSC cover the full range of forest management, including complying with the law, environmental requirements (water quality impacts, soils, biodiversity, chemical use etc.), social requirements (worker rights, indigenous peoples rights, stakeholder and community benefits etc.), alternative benefits of the forest beyond core forest products, and sound and economically viable forest management practices.

FSC accredits auditors who undertake annual audits of FSC certified forestry operations to confirm compliance with FSC requirements. HFM NZ is currently audited by SCS Global Services.

For further information about FSC visit their website www.ic.fsc.org
Copies of the audit report for our latest FSC audit can be found on the SCS website http://www.scs uncertified.com/nrc/forest_certclients.php (search under Australia/New Zealand).

2.5 PEFC (NZS AS 4708) Certification

PEFC (Programme for the Endorsement of Forest Certification) is another international forest certification system available to the forest sector. Under PEFC, countries develop forest management standards appropriate to the natural, social, physical and economic conditions of those countries with input from local stakeholders. If both the standard and the standard setting process is able to meet the PEFC criteria, the standard may be endorsed by PEFC and therefore able to be recognised through a common internationally recognised branding system.

In New Zealand, Standards New Zealand oversaw a stakeholder managed process to adapt the Australian Forestry Standard to New Zealand. The resulting Standard, NZS AS 4708 Sustainable Forest Management was endorsed by PEFC in 2015.

HFM NZ is currently undertaking the audit process to become certified to NZS AS 4708 and hope to achieve PEFC certification of our forests by mid-2017.

For further information about PEFC visit their website www.pefc.org.
A copy of NZ Standard NZS AS 4708 and associated guidance material can be found on the Australian Forestry Standard website www.forestrystandard.org.au (search under the dropdown Tab ‘standards’ and select ‘New Zealand Standard’).
2.6 External Agreements

As a member of the New Zealand Forest Owners Association, HFM NZ is bound by the requirements of the New Zealand Forest Accord (1991) and the Principles for Commercial Plantation Forest Management in New Zealand (1995).

The Forest Accord protects remaining indigenous forest remnants within the plantation forest that meet minimum size and quality criteria from clearance and conversion to plantation forest. All New Zealand Forest Accord vegetation in the HFM NZ managed estate is identified in the company Geographic Information System (GIS) and is protected.

The Principles for Commercial Plantation Forest Management in New Zealand are complementary to the New Zealand Forest Accord and cover a range of broader principles to promote environmental excellence in plantation forest management, and the protection, preservation and sustainable management of native forests.
3.0 OVERVIEW OF FOREST OPERATIONS

3.1 Silviculture

3.1.1 Introduction

Silviculture includes all practices related to the establishment, growth, composition, health and quality of a forest to meet specific objectives.

Production trees are intensively managed by HFM NZ to supply a range of wood products including clearwood for appearance uses and high density structural logs for use in construction. Intensive management involves best practice land preparation, planting of improved tree stocks and thinning (removing poor growth and/or form trees to leave a quality final crop).

The key drivers of the choice of silvicultural regime are:
- forecast of future log product demand and price
- costs
- site-related growth conditions
- the characteristics of the tree stocks available

The following sections provide a summary of the principle silvicultural activities practiced on the HFM NZ managed estate.

3.1.2 Land preparation and establishment

All harvested areas that are deemed suitable for replanting are planted within 12 to 18 months after harvesting (Some areas may not be replanted, and therefore retired from production due to environmental considerations such as creating setbacks from sensitive areas like streams). Prior to planting, sites are prepared to assist the seedling survival rate and promote early growth. This involves spraying of weed species, generally between January and April prior to planting, to remove competition for the plantation crop trees. In some areas, mechanical land preparation is also undertaken to improve site conditions for tree growth. Soil cultivation and/or mounding machines improve aeration of the soil, allow better root penetration and reduce frost damage. Slash raking is also used in some areas to remove logging debris to improve access for planting.

Site specific decisions around the appropriate herbicide rates and if required, mechanical land preparation, are made using a combination of site information (e.g. weeds present, soils and productivity) and the knowledge of experienced and well trained forestry staff.

Land preparation is followed by manual tree planting, which is generally carried out between mid-May and September. The majority of the HFM NZ managed estate is replanted with radiata pine at an initial stocking of either 833 or 1000 stems per hectare depending on the region and forest location, while some relatively small areas are replanted with Douglas fir at 1111 stems per hectare.
3.1.3 **Tending**

Thinning of stands is undertaken by HFM NZ, generally between six to nine years of age, to provide the optimum space for selected crop trees within the stand to grow to maximise their economic return. The aim is to thin out the smaller or poorer formed trees leaving the bigger, better formed trees to grow on. On flatter land, close to processing plants ‘production thinning’ may be carried out whereby the thinned stems are taken out of the stand and sold as pulp logs and sawlogs. More commonly where production thinning is impractical or uneconomic, thinning operations leave the thinned stems on the forest floor to decompose.
3.1.4 **Fertiliser application**

The HFM NZ managed estate is comprised of a wide range of soil types. Some of these are low in nutrients required for growing trees and therefore fertilisation to correct deficiencies and enhance forest health may be needed. Foliar sampling and soil information determine the type and amount of fertiliser required. Fertiliser application rates are significantly lower than other productive land uses, such as pastoral agriculture, when compared over the full life cycle of a forest.

Fertiliser application is carried out in compliance with Regional Plan rules and the Code of Practice for Nutrient Management (2007) maintained by the New Zealand Fertiliser Manufacturers’ Research Association.

3.1.5 **Herbicide application**

Herbicides are utilised for weed control prior to planting and in the first one to two years following planting to reduce competition and prevent crop mortality. Once the crop trees outgrow the weed and understory species, anywhere between one to three years of age, the trees are ‘free to grow’ and no further herbicide application is required until the start of the next growing cycle, some 25 years later.

Herbicide application is also required to control noxious weeds in accordance with the requirements of Regional Pest Management Strategies prepared by Regional Councils.

All herbicide spraying is carried out in accordance with New Zealand Standard NZS 8409:2004 *The Management of Agrichemicals* and applicable Regional and District Plan rules. The New Zealand standard ensures that where agrichemicals are handled or used, the practices followed are safe, responsible and effective, with minimal adverse impact on human and environmental health. It also requires that agrichemicals are tracked and usage recorded. The standard also includes a commitment to only use herbicides where there is an identified need and only after considering all other practicable alternatives.

When planning herbicide operations, the planner is required to identify areas which must be protected from herbicide over spraying such as significant native riparian vegetation, wetlands, watercourses, important indigenous habitat and neighbours’ boundaries. To safely use herbicides in HFM NZ forests, education and training sessions are an essential part of company policy.

While it would be ideally desirable to eliminate herbicide use, the practical and economic realities are that some controlled herbicide use is currently unavoidable. For both environmental and economic reasons HFM NZ aims to use the minimum amount of herbicide required for it to undertake its management activities. The company actively seeks and researches ways to reduce the amount of herbicide it uses during its operations. This includes measures such as over sowing and spot spraying where practical (to remove the need for broadcast releasing of trees) and ongoing trials to reduce herbicide application rates to as low as possible while still maintaining effectiveness.
In 2006 HFM NZ was involved in the controlled release of the buddleia weevil *Cleopus japonicus*. The weevil larvae selectively consume the foliage of the weed species *Buddleja davidii*, and since their initial release, have significantly reduced the need to use herbicide sprays to control the growth of buddleia in the Taumata Central estate.

Herbicides are applied to control weeds and reduce mortality and competition for crop trees. Shown above is the consequence of no weed control, over a three-month period, in a one year old radiata pine stand trial.

### 3.1.6 Forest Health

A forest health monitoring survey takes place each year to identify any health issues in the growing stands such as disease, pest damage or nutrient deficiencies. The most common disease affecting radiata pine is a fungal disease *Dothistroma* (*Dothistroma septosporum*) which causes needle cast in radiata pine and can severely slow tree growth. Dothistroma is most prevalent in the Central North Island, where the extent of Dothistroma infection, and therefore the requirement for spraying, is largely dependent on the previous spring and summer weather conditions (i.e. wet and warm conditions increase infection). Dothistroma is controlled using copper based products (cuprous oxide) similar to those used to control disease in home vegetable gardens.

The annual health survey identifies any significant outbreaks of Dothistroma and this is used to develop the annual spray programme. Significant amounts of research have been carried out to ensure that the lowest possible effective level of fungicide is used to control this disease. Even though risk is low, application is planned to ensure that drift is minimised and records are kept and audited to ensure that practices can be improved.

The fungal disease Dothistroma is the most common disease affecting radiata pine in the HFM NZ managed estate. Shown above is a stand affected by Dothistroma (left) and condition after spraying with copper fungicide (right).
3.1.7 Animal Pest Control

Animal pests pose a threat to commercial forest plantations, to significant indigenous reserve areas within the forest and to indigenous species living in the forest. Animal pests can have an immediate and long term detrimental effect on these areas.

In addition to the need to carry out control to protect the forest, Regional Pest Management Strategies contain rules which require the control of some animal pest species. Animal pests that can require control in the plantation forest include possum, rabbit, rats, mustelids, hare, wild goat and dama wallaby.

The main animal pest in the forest estate is the introduced possum, which can attack the growing tips of trees causing stem malformation and dieback. Possums are also a major pest to neighbours along the forest boundaries, as they can carry tuberculosis (Tb) to livestock. Rabbits, hares and goats can also be a pest in the first five years after planting, as they can eat the tops of young trees and in the case of goats, strip the bark.

HFM NZ pest control operations are carried out by certified professional pest control organisations. These organisations work within the guidelines of the current pest management strategy to manage animal pests and co-ordinate with complementary organisations such as the Regional Councils, Department of Conservation, the Animal Health Board and other forestry organisations. The optimum method of animal pest control is determined following a review of relevant factors such as the level of damage occurring, the current animal population, the risk of re-infestation, the possible environmental and health effects of the control, and the benefits of the control. OSPRI also carries out possum control on HFM NZ forests in some areas, as part of the national TB vector control programme.

Damage to radiata pine (left and centre) caused by possums (right)
3.1.8 Fire Protection

HFM NZ managed forests lie within a number of Rural Fire Authority areas and a number of staff serve official roles on their local Rural Fire Authority. The authorities coordinate the readiness and response of the forest industry to fires within the region. HFM NZ and our contractors own an extensive array of firefighting equipment, including fire engines. Staff and contractors are trained and are available to respond to any fire emergency, which threatens the estate or adjoining land.

From time to time HFM NZ staff and contractors have assisted with control of major fires in other parts of the world.

Fire-fighting equipment at a controlled burn. Now a rare practice, but historically used for site preparation and as an opportunity for fire training.
3.2 HARVEST OPERATIONS

3.2.1 Harvest Planning

A comprehensive planning process determines how and when to harvest the wood resource in the estate. Planning for harvesting of the forest is developed from a long term (up to 80 years) forest estate model which is then refined down to a more detailed five-year plan, and then translated into annual harvest plans. This process involves balancing a range of factors such as predicted forest growth, customer requirements (grade and volume), harvesting capacity, access, third party ownership requirements, clear fall catchment limits and other environmental constraints.

HFM NZ aims to harvest its estate as close as possible to the optimum tree age for each stand.

HFM NZ’s managed estate has a relatively even age class distribution although within each region there are significant variations. This means that the total harvest levels can be relatively stable over time, but there will be regional fluctuations in harvesting activity. However, the ability to alter the harvest to respond to market demand fluctuations does exist.

Areas of older growth exotic species and minor species do have some value in terms of forest biodiversity and are subject to separate classification in planning and management processes to ensure their genetic, scientific, historic, landscape and aesthetic values are taken into consideration. Other minor species generally occur as small areas surrounded by younger radiata pine age classes. This makes these areas effectively inaccessible until the surrounding crops are harvested. Consequently, small areas of other species will continue to contribute to the biodiversity of the forest for years to come.
All harvesting and engineering and forestry operations carried out in HFM NZ managed forests must have a harvest plan or work prescription in place. Harvest planning is carried out by experienced harvest planners who consider all possible options for access and harvesting of the block to arrive at the optimal solution. Key factors that are considered in harvest planning are:

- Health and Safety – the method that is the most appropriate for the topography and nature of land so that the potential for injury is minimised
- Environment – the method creates the least impact on the environment
- Financial – the method is the most practical and cost effective for the area taking safety and environmental considerations into account.

A key aspect of harvest planning is identification of all environmental risks of the operation, and specifying controls to manage those risks and to ensure compliance with all legal, certification and company requirements including resource consent conditions and permitted activity rules.

3.2.2 Harvesting

HFM NZ is committed to adopting harvesting techniques and technology that minimise the impact on the environment and reduce the risk of accidents and injuries.

Harvesting is undertaken by two key methodologies:

- **Ground-based harvesting:** Carried out on easier terrain (generally <25 degrees) trees are felled and extracted by machine to a processing area. In ground-based terrain, all falling is now carried out with mechanical harvesters to minimise the risk of injury during the falling operation. Only a very small proportion of ground based country is manually felled where an area is practically inaccessible to machinery. The stems are typically transported to the processing area by skidders or forwarders, and in some instances by shovel logging.

- **Cable harvesting:** Carried out on steeper country (generally >25 degrees) fallen stems are extracted through the use of a hauler (either swing yarder or tower) with trees attached by strops to a cable and dragged to a processing area. In the past falling on cable country was almost universally carried out manually by chainsaw. The advent of tethered harvesting, with falling machines operating on steeper slopes tethered by steel cable to a winch system has significantly extended the range of falling machines onto steeper country. In HFM NZ operations around 70% of cable country is now mechanically felled with the remainder still manually felled due to practical constraints to accessing areas with a falling machine.

The current harvested volume from the HFM NZ managed estate is approximately 4.4 million tonnes per annum.
Harvest operations in Houpoto forest, Taumata Plantations Limited estate
4.0 HEALTH AND SAFETY

4.1 Introduction

At HFM NZ our goal is that everyone goes home safe – every day. We believe in a culture where the health and safety of all people is an over-riding priority. Work should only be done if it can be done safely.

A copy of the HFM NZ Health and Safety Policy is attached in Appendix I.

4.2 HFM NZ Health and Safety Strategy

HFM NZ has developed key strategies to achieve our health and safety objectives. These are summarised below:

Leadership

Leadership is the single most important element of our strategy. Active, visible and consistent leadership is critical to our achieving world class safety results. Leaders include not just the HFM NZ Board and senior management but also front line leaders and employees who step up to lead.

We will lead by example and work to instil a culture where safety is consistently seen as the highest priority in our business.

A key role of leaders is to enable the shift to an employee driven culture where every employee has ownership of safety processes and activities within their work area. Leaders provide the time, tools, resources, coaching and support necessary for employees to successfully lead the activities for which they have taken ownership.

Employee engagement is seen as a cornerstone to achieving an outstanding safety culture. Our goal is to create a workplace where everyone working in our operations is fully engaged and empowered to do their part to achieve a safe workplace and where safety is seen as the collective responsibility of all of our people.

Key initiatives include:

- Targeted ongoing leadership training programmes and mentoring to improve the standard of health and safety leadership at all levels of the organization.
- Effective Health and Safety committees at each level of the organization with meaningful contractor input to drive continuous improvement and innovation in H&S Management.
- Positive engagement and two-way communication with staff, contractors and their employees to develop a strong safety culture and achieve continuous improvement.
- Maintenance of a Drug and Alcohol free workplace.
- Ensuring Health and Safety is a key measure when engaging and managing staff and contractors, and measuring their performance.
- Recognition of excellence in Health and Safety Performance.
• Monitoring of H&S culture via a periodic H&S culture survey to monitor any changes and areas of key focus to improve.

Basics done well

We believe ‘doing the basics well’ is a key foundation for achieving our Health and Safety goals. It is our aim to have strong, effective and practical systems that are well understood and adhered to, meet or exceed regulatory requirements and focus on the things that make a difference to keep people safe.

We will ensure that staff and contractors are well trained and have the appropriate skills and tools to support them to make the right decisions on the job, every time.

Key strategies to support these goals include:
• Maintaining clear and fit for purpose policies, systems, procedures and work rules that align with regulatory requirements and are regularly reviewed and updated where required.
• Periodic external review of our systems to benchmark our processes and drive continuous improvement.
• Provision of training to ensure staff, contractors and all workers understand the requirements of their roles and are fully prepared for the work they undertake.
• A strong focus on identifying and managing risk through robust hazard identification and management processes.
• Regular and comprehensive auditing and monitoring to ensure compliance with company systems and legal requirements.
• Accident and incident reporting, investigation and monitoring to ensure key learning's and trends are understood and disseminated to focus effort on those areas that will make a difference and drive continuous improvement.
• Having a clear set of non-negotiable ‘life-saving rules’ that all employees (staff and contractors) are made aware of with clear consequences for breaches.

Drive for Innovation

We will continually look for ways we can do things better to enhance the safety of our people through both iterative and step change improvements in work practices and systems, year on year. In doing so our goal is to act strategically and always focus on the things that we believe will make the greatest improvement, recognizing this will change over time as solutions for key issues are found and implemented effectively.

We will achieve this through:
• Focusing on the highest risks faced in our operations with the ultimate goal of elimination of manual tasks with a high potential for serious harm or fatality.
• As goals are achieved, undertaking periodic review of operations to identify new priorities.
• Always challenging the status quo and looking for innovative solutions to problems.
Key strategies to achieve these goals include:

- A strategic drive to use technology and/or changed work practices to address the highest risk tasks and minimise worker exposure to hazards that could cause serious harm or fatality.
- Regular periodic review of safety statistics and outcomes of incident investigations to identify those areas of highest priority.
- Use of focus groups (such as Subcommittees of the Peak HSE Committee) made up of staff and contractor representatives to tackle and develop solutions for identified priority issues.
5.0 ENVIRONMENTAL STEWARDSHIP

5.1 Introduction

HFM NZ is committed to maintaining a high standard of environmental stewardship when managing our forests and activities and ensuring the long-term sustainability of our operations.

Environmental effects are a key consideration when planning and managing our operations, second only to ensuring operations are undertaken safely.

The HFM NZ Environmental Policy is attached in Appendix I. The following sections provide more information about the key aspects of HFM NZ’s environmental stewardship programmes.

5.2 The Environment and Forestry Activities

Forestry activities encompassing silvicultural and harvesting operations can have both beneficial and adverse impacts on the environment depending on the quality of environmental and operational planning and management. Well managed forests can:

- enhance water quality
- stabilise and conserve soil
- provide a buffer against flood flows during storms
- shade waterways keeping water cool for enhanced fish and macro-invertebrate life
- provide habitat for rare, threatened and endangered native species;
- sequester carbon to combat climate change, and
- provide recreational, economic and social benefits to the community

On the other hand, poorly managed forestry activities can have harmful impacts. HFM NZ aims to identify the potential negative impacts that our activities may have and to implement environmental safeguards to prevent or to minimise the negative impact from its operations.

HFM NZ implements a range of measures at each stage of its forestry operations to prevent or minimise the adverse impacts of its forestry activities on the environment. The company audits and reviews its safeguard mechanisms regularly to ensure that its systems continue protecting the natural and physical resource base effectively.

HFM NZ’s Environmental Management System (EMS) is the primary tool used for ensuring that company operations meet the highest environmental standards. The EMS details processes to be followed from initial planning through to completion of operations. It also sets out auditing, monitoring and review procedures which help to ensure continuous improvement of environmental performance.

The EMS sets out clearly the company’s obligations, and those of its contractors, to protect identified environmental values in the areas in which we operate. This may include areas such as waterways and wetlands, indigenous
reserves, neighbours’ boundaries, conservation areas, historic and cultural sites and high value landscapes. Specific procedures, including monitoring the impact of operations, are followed to ensure protection of these areas.

Any forest establishment work (including herbicide application), earthworks and harvesting operations that have the potential to impact on areas of high ecological value are identified as high risk. Work in such areas is carefully planned, mapped and prescribed. Specific environmental protection requirements are provided for operators to follow. Operators undergo training and receive specific in-situ advice to ensure they understand the importance of these issues.

Contractors must follow the prescription plan and monitor their operations on a day-to-day basis to ensure that such sites are being safeguarded. Ensuring that reserve and sensitive areas (e.g. adjacent native bush, wetlands and streams) are not damaged is a focus.

The EMS is designed to ensure that the company follows all the regulatory requirements and meets agreed industry standards.

5.3 Planning of Operations

At the beginning of the planning phase of harvesting, establishment and earthworks operations, it is determined whether a resource consent under the Resource Management Act 1991 or an Authority under the Historic Places Act 1993 is required. HFM NZ undertakes consultation with all those parties who may be affected by the operation. Where a consent is required, an application, which includes an assessment of the actual and potential effects of the proposed activity, is submitted to the local authority. The application also provides details of the measures to be used to prevent or minimise adverse effects.

All operations on the HFM NZ managed estate must have a Work Prescription in place before work commences (for harvesting operations this is called a Harvest Plan). Through the planning phase the planner inspects the site and gathers information on all of the site characteristics and constraints to confirm or supplement recorded information held in the GIS. Taking into account environment, safety, economic and practicality considerations the planner develops the optimum methodology for carrying out the particular operation. This plan is then documented in the work prescription and includes a map of the site and instructions for completing the job. Any site specific environmental constraints are documented in the Work Prescription and where applicable, identified on the Work Prescription map. Each operation is assigned an environmental risk rating (high, medium or low) based on the characteristics of the site. This alerts the contractor of the relative risk level of the particular job, and is also used by HFM NZ to prioritise the frequency of operational and post-operation audits.

Prior to commencing operations, hazard identification is undertaken on site with the contractor to ensure all safety and environmental hazards are clearly identified with controls in place.

Contractors are required to comply with the Work Prescription as well as with any applicable resource consent conditions. Compliance is monitored by HFM NZ operational staff during and on completion of operations.
5.4 Protection of Rare, Threatened and Endangered Species

HFM NZ is committed to managing our forests to maintain a diversity of indigenous flora and fauna species. Of particular importance are rare, threatened and endangered species living within the estate.

HFM NZ has undertaken a review to identify all rare, threatened and endangered species either confirmed or suspected to be present in the estate. Management Plans are progressively developed for all species confirmed to be present, focusing initially on those areas where harvesting is imminent. Management plans are prepared with input from Department of Conservation (DOC) and other recognised technical specialists.

Any permanent habitat for rare, threatened and endangered species is recorded in the GIS mapping layer as ecological restrictions and taken into account during planning of operations to ensure compliance with the Management Plans.

In conjunction with other forestry companies HFM NZ has supported two threatened species projects researching the NZ bush falcon and long-tailed bat in plantation forests (refer section 6). In both cases the research is aimed at gaining a better understanding of how those species use plantation forest habitats and developing management recommendations to further enhance their success.
Waituhi Forest Blue Duck Project

Waituhi Forest is located east of Taumarunui and bounds onto Pureora Forest Park to the north. For some years staff had been aware that blue duck were present along the riparian margins of the Pungapunga Stream that runs through the block from Department of Conservation (DoC) land. A survey in 2009 confirmed four breeding pairs were using the stretch within Waituhi Forest up to the DoC boundary.

Blue duck are endemic to New Zealand and listed as a threatened species (‘nationally vulnerable’) with an estimated 2,000 and 3,000 birds remaining, of which it is estimated around 640 pairs live in the North Island. Blue duck live in clean, fast flowing bouldery rivers and streams located within forested catchments. They establish exclusive territories and strong pair bonds, with a breeding pair occupying the same stretch of river year after year.

As with many of New Zealand’s indigenous birds, blue duck are heavily predated by introduced mammals, in particular, stoats. To protect the population, HFM NZ with support from Horizons Regional Council, DoC and Genesis Energy established a trapping network over a 5km reach of the Pungapunga stream in 2011.

It is hoped that with trapping of predators we will enhance the breeding success of the small population to increase numbers both within Waituhi Forest and the adjacent Pureora Forest Park. Each year HFM NZ’s trapping contractor undertakes a population survey to confirm numbers and rearing success, with our best year to date being the summer of 2014/2015 when twelve chicks were successfully reared.

![Adult blue duck on the Pungapunga stream, Waituhi forest](image)
Whatoro Kiwi Recovery Project

Kiwi were once widespread on mainland NZ but have been greatly reduced by predation, in particular by dogs, cats and mustellids (stoats, ferrets and weasels). Although adult kiwi are relatively robust, kiwi chicks are very vulnerable to predation and typically, only 5% of chicks survive their first year in the absence of pest control.

Northland as a region has the highest remaining population of North Island Brown Kiwi, and many of the Taumata Northern forests contain kiwi which make use of both the native reserves and plantation forest for habitat. HFM NZ staff are involved with the Northland Kiwi Recovery Group on kiwi recovery initiatives.

HFM NZ's main kiwi recovery initiative in Northland is the Whatoro Kiwi Recovery Project, based in Taumata’s Whatoro Forest in eastern Northland. Whatoro Forest is located in an area with naturally high kiwi populations and was selected as a priority due to its location between two Department of Conservation (DoC) forests actively managed for kiwi (Trounson and Kaihu Forest Parks). HFM joined forces with the Northland Regional Council (NRC), Department of Conservation and neighbours to develop a Community Pest Control Area (CPCA) over approximately 1200ha including Whatoro forest and three neighbouring farms. NRC provided financial support for the initial set up and running of the project, with HFM and the three neighbours responsible for longer term management.

The main objective of the project is to enhance kiwi survival by controlling kiwi predators within the project area and extending the area of protected kiwi habitat. Through the CPCA, HFM and the adjacent landowners have made a long-term commitment to predator control in the area.

Taumata Plantations also supports three other community led kiwi recovery projects in Northland; the Kiwi Coast, Taheke Landcare Trust and Marunui Kiwi Recovery Projects. Each of these projects incorporate parts of Taumata Forest with Taumata providing financial and in-kind support. These projects are a great way to support local kiwi recovery initiatives by extending the area of protected habitat, and also create connections with local communities. These projects all contribute to a network of protected habitat helping to halt the decline of kiwi in the wild in Northland.
5.5 Indigenous Reserves Management

5.5.1 General

HFM NZ manages approximately 28,000 hectares of indigenous forest remnants located within its estate boundaries. The majority of the indigenous forest remnants were in place and reserved at the time of establishment of the plantation forests but, over time, the reserve area has expanded as areas are identified that are not suitable for productive use and are retired from production.

All reserve land is identified in the company GIS mapping system and managed as permanent reserve. Ecological assessments of all reserve areas have been undertaken by independent ecologists (Wildland Consultants) utilising a range of information including:

- Mapping information and aerial photography to identify the location of reserves and site boundaries
- Any previous ecological reports for sites in the forest such as DOC Protected Natural Area Programme (PNAP) or threatened species reports
- Site surveys by qualified ecologists to record vegetation and habitat types and relevant observations of flora and fauna
- At some sites bird recordings were used to confirm presence of indigenous bird species (e.g. kiwi, spotless crake, fernbird)

Survey reports were produced for each region detailing for each individual site:

- A description of flora and fauna values present within the reserve based on previous reports and field visit observations, including any threatened species observed or previously recorded;
- Ecological significance ranking: Each individual site was assessed and given a ranking using Ecological Districts, bioclimatic zones and landform units as the framework. Each site was evaluated against available information about the particular Ecological District using information from the NZ Land Cover Database (2001 and 2004) and relevant DOC PNAP reports for the district. The ecological significance assessment was based on standardised criteria including representativeness, diversity and pattern, naturalness, size and shape, rarity and special features, buffering and connectivity, and viability. Using a standard process, sites were assigned a ranking from Category 1 (largest, highest quality or particular rare ecosystems) down to Category 5 (generally relatively small sites dominated by exotic species). The ecological significance ranking is used as a guide for prioritising site management; and
- Management recommendations for each site where applicable.

All reserve sites are recorded in the HFM GIS mapping system with summary information, including the unique site number, which can then be used to access more detailed information in the ecological assessment reports.

HFM NZ has an Indigenous Reserves Management Plan and from this an annual programme of reserve restoration work is developed. The ecological assessments form the basis for establishing priorities along with other guidance from the Ministry for the Environment (MfE), regional councils and community interests in particular areas. In a number of instances, HFM NZ has partnered with local organisations and the DOC in reserve restoration projects.
5.5.2 Reserves Restoration Projects

The following is a summary of some of the current reserve enhancement projects on HFM NZ managed lands.

Wetland Enhancement Projects in Central and Eastern regions

Wetlands were once widespread across much of lowland NZ, but their extent has been greatly reduced through draining for farmland. In the Waikato region it is estimated that less than 5% of the original wetland remains. In plantation forests land drainage is uncommon and therefore wetlands tend to be over-represented in comparison with adjacent farmland.

All areas of wetland ecosystem in HFM NZ forests have been identified in the company GIS and mapped as reserve, and many of the larger wetlands have also been identified as Significant Natural Areas under District Plans. While the original extent of the wetland vegetation remains, a lot of the wetland areas in our Central and Eastern region forests have been invaded by introduced weed species, in particular Grey Willow. HFM NZ commenced a wetland restoration programme in 2007.

Willow control being undertaken in the Opareiti wetland in Kinleith Forest.

To date approximately fifteen wetland areas totalling over 160ha in area have been treated in the Kinleith and King Country Forests. Following the harvest of plantation trees surrounding wetlands, HFM NZ reviews replant boundaries and where necessary the boundary is setback further from the wetland to create a protective buffer. In two particularly significant wetland areas in Kinleith Forest (Lake Rd and Hoiho wetlands) HFM has established ongoing animal pest control operations to enhance native bird populations.

In the Taumata Eastern forests, restoration work has been focused on the 110ha Houpoto Forest wetland, a wetland of regional significance. Being a lease forest, the restoration work has been undertaken in conjunction with the
landowners and with support from the Bay of Plenty Regional Council. The Houpoto wetland project work has largely been weed control.

More recently HFM NZ has undertaken enhancement work on the Te Ranginui Road wetland in Orete Forest. Te Ranginui Rd wetland is a small kahikatea wetland located on an old mudstone landslide feature in Orete Forest. The forest is in good condition but the juvenile native plants were overtopped by large grey willow. A two-year control programme is underway to remove the grey willow.

**Dactylanthus taylorii recovery project (Kinleith Forest)**

Dactylanthus is a rare plant that is New Zealand's only fully parasitic flowering plant, growing largely underground with the plant growing from a stem attached to the root of a host tree. In response to Dactylanthus, the host's roots mould into the shape of a fluted wooden rose giving the plant its common name of 'wood rose'.

Dactylanthus are also unusual in that they are pollinated primarily by very rare short-tailed bats, along with mice and wasps. The host trees are very site specific, occurring only on the margins of podocarp forest in the regenerating shrub/hardwood areas containing mahoe, lemonwood, kohuhu, five finger and lancewood.

Dactylanthus was identified in a reserve in Taumata's Kinleith Forest near Tokoroa. Dactylanthus is vulnerable to damage by browsing animals, in particular pigs. With assistance from DOC, protective cages have been installed over the identified plant locations and the population is monitored annually.
**Dune Lakes restoration (Te Kao forest)**

Te Kao forest, in the Far North, contains two large dune lakes, Morehurehu and Te Kahika, which are rare within Northland and have been designated as Significant Natural Areas by the Far North District Council. The areas have also been identified as High Conservation Value (HCV) Areas, due to their classification as rare ecosystems. The lakes’ riparian margin vegetation contains the rare fern *Todea Barbara* and the rare native bladderwort *utricularia australis* is found within both lakes. The lakes also provide habitat for a range of rare bird species, including bittern, fernbird, dabchicks, black shags, grey duck, and scaup.

HFM has developed management plans for the lakes’ ecosystems in consultation with the forest landowners, Parengarenga-A Incorporation. Following harvesting, HFM NZ has retired a 20m buffer zone around the lakes’ edges and undertaking control of exotic weeds to allow regeneration of native species. Target species in these operations include wilding pines, golden willow and the pest plant, Oxylobium. Weed control has been undertaken progressively; cutting and poisoning target weed species to enable the native species to achieve canopy closure, improving the overall ecology of the rare dune lakes ecosystem.

### 5.5.3 Management of ‘High Conservation Value’ Areas

Under the FSC Principles and Criteria, certified forestry companies are required to identify reserves within the forest estate that meet the FSC definition of High Conservation Value (HCV) and develop management plans, as required, to maintain or enhance the high conservation value attributes that define such forests.
Under the FSC Principles and Criteria, HCV’s are defined as those reserves that possess one or more of the following attributes:

- **HCV1:** Forest areas containing globally, regionally or nationally significant concentrations of biodiversity values (e.g. endemism, endangered species, refugia).

- **HCV2:** Forest areas containing globally, regionally or nationally significant large landscape level forests, contained within, or containing the management unit, where viable populations of most if not all naturally occurring species exist in natural patterns of distribution and abundance.

- **HCV3:** Forest areas that are in, or contain rare, threatened or endangered ecosystems.

- **HCV4:** Forest areas that provide basic services of nature in critical situations (e.g. watershed protection, erosion control).

- **HCV5:** Forest areas fundamental to meeting basic needs of local communities (e.g. subsistence, health).

- **HCV6:** Forest areas critical to local communities’ traditional cultural identity (areas of cultural, ecological, economic or religious significance identified in cooperation with such local communities).

Note: Reference to regionally in this instance refers to a global region, not a region within New Zealand, i.e.: sites must be at least nationally significant to meet HCVF criteria 1 and 2.

HFM NZ has undertaken an assessment of the entire estate using a range of data and information sources. The following is a summary of assessment process used to identify qualifying sites under each of the criteria:

- **HCVF 1-3:** To identify sites of ecological or environmental significance (HCVF 1-3) the ecological assessment reports described in section 4.6 were used as the base information, with the ecological ranking used as an initial guide of potential HCVF sites. Wildland Consultants undertook an initial assessment of reserves on the HFM NZ managed estate to identify potential HCVF sites. All sites within the estate with an ecological significance ranking of Category 1 or 2 were evaluated under the HCVF definition, and recommendations were made in relation to potential HCVF sites.

Consultation was then undertaken with DOC and Regional Council biodiversity specialists for each forest region, to review Wildland’s findings and provide further input and opinion based on their specialist knowledge.

In most cases, Regional Council staff utilised assessments of reserve areas carried out by their Councils to identify sites in their region that met Section 6(c) of the Resource Management Act (areas of significant indigenous vegetation and significant habitats of indigenous fauna). Regional Councils have developed criteria for identifying Section 6(c) sites in their region which in most cases is documented in their Regional Policy Statement (e.g. Waikato Regional Policy Statement Appendix 3). Most Councils have commenced identification and mapping of those sites that meet the criteria in their region. Where the Regional Council process had identified a site as
nationally significant through this process, this generally corresponded to the site being classified as meeting either HCVF criteria 1 or 2.

DOC staff also provided advice on the ecosystem values of reserve areas under consideration, and also advised on the significance of known populations of threatened species within the HFM NZ managed estate (HCVF 1). A number of known populations of threatened species within the estate were identified by HFM NZ as potential HCVF (whio, kiwi, dactylanthus, Pittosporum turnerii and weka). DOC staff were able to identify which sites were considered to be ‘nationally significant concentrations’ based on their own threatened species management plans and survey information.

Through this process of consultation, a number of sites were identified that consulted parties agreed met one or more of the HCVF criteria 1-3, and these sites have been included in the HCVF list.

- **HCV 4:** An initial assessment of sites that potentially meet HCVF 4 was undertaken by HFM NZ Environmental Planner Robin Black (a geologist and former Regional Council Soil Conservator). Through this process a small number of sites critical for erosion control were identified as potential HCVF 4, and these were discussed further with soil conservation staff from the relevant Regional Council. This process led to the identification of one potential site in the Eastern Bay of Plenty as a proposed HCVF 4 site. Consultation is underway with the Regional Council and landowners prior to confirmation of this site on the HCVF list.

- **HCV 5:** It was concluded that in a NZ context with publicly funded health and social welfare systems, there are no communities dependant on forests for their fundamental needs (subsistence or health) and therefore no forests were identified under HCVF 5.

- **HCV 6:** Identification of forest areas critical to local communities’ traditional cultural identity (areas of cultural, ecological, economic or religious significance) falling under HCVF 6 has been an ongoing process. A review of recorded cultural and historic sites within the forests was undertaken by HFM NZ staff and consultation initiated with relevant tangata whenua representatives to obtain their views. Through this process a number of HCVF have been confirmed in Woodhill and Kinleith forests, due to the significant presence of cultural values.

The HCV assessment process is ongoing as more information comes to light and understanding of the HCV criteria in the NZ context develops. The HCV list is reviewed and updated each year in consultation with stakeholders where relevant.

A list of the current HCV sites identified on the HFM NZ managed estate is attached as Appendix III. Key individuals and organisations that provided input to the HCV assessment process are listed in Appendix IV.

As noted above a small number of further potential sites have been identified that are still in the consultation phase with relevant stakeholders. Where agreement is reached that the sites meet the HCV criteria, these sites will be added to the list.
As required by FSC, HFM NZ has developed management plans for those areas identified as HCV and is progressively implementing these, in consultation with landowners in the case of lease and joint venture forests. Each area is inspected annually to monitor the condition of the particular values identified as HCV, to assess the effectiveness of any management actions undertaken and to determine the need for any further active management. A brief summary of key management actions for each site is provided in Appendix III. Full management plans are available on request.

### 5.6 Historic Sites Management

A number of the forests managed by HFM NZ contain significant numbers of historic sites and waahi tapu as a result of early human occupation. Unrecorded sites are also regularly found during the course of harvesting.

Historic sites are vulnerable to damage when undertaking earthworks and harvesting. HFM NZ has a Historic Places Management Procedure, which specifies the procedures that must be followed when working around archaeological sites, either known or discovered during the course of the operation.

*Pohaturea, near Atiamuri in Kinleith Forest. The maunga is of cultural importance to the Raukawa, Te Arawa and Tuwharetoa people. Due to past occupation during times of war the maunga has numerous archaeological features (house sites and kumara pits). The site has been identified as an HCV area for cultural reasons.*
All known sites are recorded in the GIS and taken into account in planning of operations. No operations are undertaken which could potentially damage or modify an archaeological site without the necessary authority from the Historic Places Trust. Once the authority is obtained this becomes part of the Work Prescription of the operation to ensure conditions of the Authority are complied with.

When a notable site is identified during an operation, the procedure requires all work to cease within 30m of the site and the site is visited by an archaeologist and, in the case of Maori sites, local tangata whenua representatives. If the feature is confirmed as an archaeological site, an operational plan is developed with input from the archaeologist and iwi representatives and, if necessary, an authority is sought from the Historic Places Trust.

In areas of forest with a high likelihood of new sites being discovered, all staff and contractors are provided training on identification of archaeological site features and procedures that must be followed in the field. As a result of this training and the systems we have in place, a considerable number of sites that have not been previously recorded have been identified and protected in the course of routine forestry operations.

5.7 Environmental Incident Management

While HFM NZ strives for excellence in the performance of its forestry activities it is inevitable that incidents will occur on occasions. When the company becomes aware an incident has occurred, it acts promptly to minimise and remedy adverse impacts on the environment. All incidents are required to be reported and significant incidents are investigated to ensure staff and contractors learn from the experience and management processes are reviewed and revised to avoid repeat incidents.
6.0 THE COMMUNITY

6.1 Stakeholder Engagement

Through our management of large areas of forest land, HFM NZ is an integral part of the communities in which it operates, and as a significant business and employer, contributes to the sustainable development of these communities. Community relations are an important focus for the company and HFM NZ is committed to being ethically and socially responsible.

HFM NZ strives to actively engage with stakeholders in the many communities in which we operate, and particularly those directly or indirectly affected by our operations. Prior to commencing harvesting in a new area, HFM NZ engages with representatives of the local community to keep them informed of plans and develop mitigation strategies for identified concerns. Typically, this includes forest neighbours, residents of any rural access roads affected by logging traffic and tangata whenua.

Maori are key stakeholders both as tangata whenua and also in the case of Maori lease hold forests, as business partners and the forest landowners. Tangata whenua are actively involved in providing input to forest management decisions, particularly where it relates to environmental impacts and maintenance of biodiversity and ecological values. Tangata whenua are also actively involved in the management of operations around historic sites, and long term management of the sites themselves.
Raukawa Totara Legacy Project

In 2014 the Raukawa Charitable Trust staff first raised with HFM their aspiration to establish a resource of plantation grown Totara in the South Waikato for future cultural use by the Raukawa people. HFM and the directors of Taumata Plantations Ltd (owners of Kinleith forest) were supportive of the idea and HFM staff then worked with Raukawa to identify suitable areas. An area of land near the location of the old Te Whetu village within Kinleith was identified as a suitable site. Known to Raukawa as ‘Taranaki’, the area had in the past been grazed and was overgrown with blackberry and willow.

After many months of planning, the physical work commenced with the clearance of weed species from the area in early 2015. In August 2015, HFM and Raukawa gathered together, along with many friends and supporters to undertake the first planting on the site. Much like Radiata Pine, the form of a Totara tree is influenced by its stocking rate and surrounding vegetation. The advice from indigenous tree specialists at Scion was to first plant a nursery crop of native species, and then in later years under plant the area with Totara, so as to encourage the Totara trees to grow straight and tall. The first planting at the site was therefore the planting of manuka and pittosporum to form the nursery crop.

Raukawa and HFM forestry staff are keeping a close eye on the planted area to manage weeds and pests to ensure crop survival, with the next key step being the planting of the Totara crop in approximately 2018. The seedlings for this are being grown from seed sourced from Totara growing in the local area.

Longer term, it is hoped that the project will provide a sustainable source of Totara for uses such as waka building, carving and marae restoration. The Totara Legacy Project is certainly one of HFM’s longest term stewardship projects, with Totara likely to take 120 years to be ready for harvest. In the shorter term, it is hoped the area will become a special area to be enjoyed by all who visit. The area has been marked by the erection of a ‘Po’ by Raukawa Charitable Trust, and the installation of a time capsule with information and messages to future generations, to be opened at the time of harvest.
HFM NZ has developed a Social Impact Assessment (SIA) Procedure to recognise and manage decisions that may have significant impact on the local community. Key staff receive training in SIA techniques.

HFM NZ runs a stakeholder forum in the Central Area attended by a range of stakeholders, aimed at keeping communities informed about our activities and creating a forum for exchange of information and concerns. Consultation in Northland is carried out at the community level where meetings are scheduled when activities occur or change.

HFM NZ issues a six-monthly stakeholder newsletter sent out to stakeholders on our database, which is available on request.

6.2 Socio-Economic Conditions

HFM NZ has offices in Tauranga, Rotorua, Whangarei and Tokoroa and our contracted workforce is spread through a number of smaller communities in the vicinity of the forests that we manage. The forest estate that HFM NZ manages on behalf of Tiaki Plantations Company and Taumata Plantations Ltd is located in areas of rural New Zealand where there have at times been high levels of unemployment relative to the rest of New Zealand, due partly to the limited range of jobs available in small communities. The economies of these communities are often heavily dependent on forestry or forestry related industries.

The largest town centre in the locality of the Central North Island region forests, Rotorua, also has a strong tourist base, which is enhanced by the plantation forests and their recreational opportunities.

6.3 Employment

Forest management requires educated and well trained employees, who understand not just their technical roles, but also the impact of those roles on the community and the environment.

HFM directly employs approximately 85 staff. In addition, HFM clients engage a significant number of contractors who undertake a range of forest management activities from mensuration and forest protection through to engineering and harvesting. HFM NZ has also contracted two local organisations to provide logistics and sales and marketing services. Many of these organisations also contract to other forest managers in the area and are major employers, particularly in the Central North Island.

Future employment creation was a major driver for many of the Maori trusts and incorporations who are our lease partners, and in some cases employment provisions are contained within the lease documents. HFM NZ strives to employ contractors with local connections and many of our contractors and their employees affiliate to the local iwi and the land on which they are working.

Staff and contractors receive various levels of training on an on-going basis and are encouraged to continuously improve their performance through performance based reward and remuneration systems. In the Northland region, HFM NZ has taken an active role in initiating training courses to assist young people into the industry.
6.4 Recreation

HFM NZ forests are used for a wide range of recreational activities, including walking, running, mountain biking, motor-cross, horse riding, pig hunting, deer stalking, quad bike riding, orienteering, and a range of other activities. In many cases, the forest is a major recreation resource for local communities.

Woodhill Forest in particular is a major recreation resource for the Auckland Region due to its location less than 45 minutes from Auckland City. Woodhill receives hundreds of thousands of visitors every year, and has a number of permanent businesses operating recreation activities within the forest.

Access to our forests is, in most locations, managed through a system of access permits. The challenge for HFM is to enable reasonable recreational access to the forest, while also ensuring protection of environmental and ecological values, and the safety of both recreational users and HFM staff and contractors.

Lease and joint venture forests are generally not open to the public, and access is in most cases managed by the landowners.

HFM has made a commitment to cater for recreation in its forests, provided that the recreational activities are compatible with commercial, environmental and safety objectives.

Woodhill Tree Adventures high ropes course in Woodhill Forest, Auckland
7.0 MONITORING

7.1 General

HFM NZ conducts a comprehensive monitoring programme to aid understanding of the impact of its activities on the environment and the impact of the environment on its ability to grow the best trees. This understanding leads to the development of strategies to ensure the company continues to manage its activities in a sustainable way.

7.2 Operations Monitoring

HFM NZ regularly conducts internal environmental audits to confirm operations have been carried out in accordance with work prescriptions and regulatory requirements, and to identify any corrective actions required.

In addition, HFM NZ staff undertake bi-annual Environmental Systems Audits with all contractors operating in our estate to ensure they are complying with our Environmental Management Systems and company procedures.

Regional Councils also conduct regular resource consent compliance monitoring of operations undertaken under resource consents or permitted activity rules.

7.3 Biodiversity Monitoring

HFM NZ conducts a range of surveys across the estate to monitor both impacts of forestry operations on indigenous fauna and to monitor the health and changes to populations. The monitoring programme is gradually being extended as Management Plans are developed but currently includes:

- Monitoring of native fisheries in selected streams across the estate using electric fishing and/or spotlighting. Monitoring is generally commenced prior to harvesting and repeated during and post-harvest to monitor any changes in fish populations as a result of harvesting. Results are reported through to the NZ Freshwater Fish database to compliment surveys undertaken by other parties such as the DOC.
- Periodic monitoring of rare, threatened and endangered species populations to monitor changes in populations and over time the effectiveness of Management Plans. Current threatened species monitoring in HFM NZ forests includes:
  - Kiwi populations in Northland forests
  - Weka in Torere forest in the Eastern Bay of Plenty
  - Blue duck in Waituhi forest in the King Country
  - Hochstetters frog distribution in Torere Forest, Eastern Bay of Plenty
- Annual monitoring of HCVF sites to monitor the health of particular values resulting in HCVF status.
- Bird population surveys and animal pest surveys in selected reserve areas where active restoration is underway.
Staff and contractors are encouraged to report sightings of rare, threatened and endangered species, such as NZ falcon, weka and kiwi. This data is recorded in an HFM NZ sightings database. Where appropriate the data is entered into national databases such as the Raptor Association database.

HFM NZ and other agencies, including Regional Councils, monitor plant and animal pest species within and adjacent to the estate. This includes some limited monitoring of the impact of pests on indigenous vegetation within the forest and also outside the forest in selected sites.

7.4 Forest Growth and Dynamics

Forest growth is monitored through a combination of permanent sample plots and regular forest inventory.

Permanent sample plots are established early in the life of a crop, across a wide range of different sites and under different management conditions. They are carefully remeasured at regular intervals, usually annually, until age 10, and then every second year until harvest. Measurements from permanent sample plots provide an accurate picture of long-term growth trends. This data is used to develop growth models applicable to the forest resource and to validate their performance.

Plot measurement and maintenance is managed internally, but the data is processed and maintained on the Scion Permanent Sample Plot System.

Forest inventory is undertaken at regular intervals during the life of a crop. Trees are measured in temporary sample points. The first formal assessment is at about age 10. Up to three further assessments may be carried out, culminating...
in pre-harvest inventory. These measurements form the basis of the yield tables used to model the likely harvest volume available from the forest estate.

7.5 Sustainability Monitoring

Implementation of processes for monitoring sustainability within the plantation estate is based around a series of permanent sample plots, on representative soil types, which will be maintained over successive rotations.

These plots are being used as sites to monitor:

- Tree and stand growth rates.
- Soil disturbance levels at harvest.
- Soil properties.
- Understorey vegetation.
- Forest health.
- Nutrient content of tree foliage.

7.5 Research Projects

HFM NZ is involved with or contributing to a number of research projects to improve understanding of the effects of plantation forestry.

In conjunction with other forest managers, HFM NZ contributed to a project to better understand the use of the plantation forest by NZ Long-tailed Bats1. Based in Kinleith Forest near Tokoroa, the study involved capturing and tracking bats in the forest to confirm their roost locations and movement patterns. The study revealed, for the first time, the unexpected finding that bats were roosting and breeding in the plantation forest. The study was completed in 2010.

HFM NZ supported a similar project investigating the use of plantation forests by New Zealand bush falcon that took place on the Kaingaroa Timberlands estate2. The project is now complete and has confirmed that falcon are actively living, nesting and breeding in plantations, making use of the habitat provided by plantation forest cutover near to mature forest edges for nesting. Recommendations from that project are now being implemented in HFM NZ managed forests where falcon are present.

HFM NZ has also provided assistance for a PhD research project analysing the impact of woody debris, based in Houpoto Forest in the Eastern Bay of Plenty. The study was aimed at understanding the effects (both positive and negative) of harvesting debris in a small coastal stream. The study is now complete and the thesis is available through the University of Waikato website.3.

3 The physical and biological function of woody debris in New Zealand’s forested streams, Baillie, B. R; 2011, University of Waikato
HFM’s clients contribute funding to research benefitting plantation forestry through the Forest Growers Levy, introduced in 2014. HFM also contributes to a specific body of work funded by a grouping of FSC certified forestry companies in New Zealand to progress herbicide research with the goal of reducing herbicide use over time and/or transitioning to more benign formulations.

*Fitting a tracking device to the NZ Bush Falcon as part of a PhD study, Kaingaroa Forest.*

APPENDIX I: Health & Safety and Environmental Policies
HEALTH AND SAFETY POLICY

Our goal is that everyone goes home safe - every day

We believe

- That all fatalities and injuries are preventable
- In a culture where the health and safety of all people is an over-riding priority
- That excellence in health and safety is crucial to our long-term success
- All incidents are preventable
- The behaviours of our leaders influences safety
- That anyone can stop an unsafe act

Our Commitment is to

- Safety being a key performance measure and a primary value of our company
- Lead by example
- Have world class policies and procedure that effectively manage risks to keep people safe.
- Install a culture where employees and contractors are fully engaged and safety is seen as a collective responsibility for all.
- Empower our employees and contractors to participate in the identification, elimination or control of risks and hazards
- Comply with relevant Health and Safety laws, Regulations and Industry Codes of Practices.
- Focus on things that make the biggest difference and continually look for ways we can do things to enhance the safety of our people
- Develop; and maintain a positive safety culture
- Seek continuous improvement through effective review
- Maintain safety management systems that conform to recognised standards and strive for continuous improvement
- Ensure that all workers in our workplace are trained and deemed competent or under training and supervision for the task they are performing.
- Consult with our employees and contractors and their representatives as appropriate in the quest for safer workplaces.
- Encourage employees and contractors to extend their commitment to safety and good health beyond the workplace

Employees and Contractors shall share the responsibility and must

- Promptly report incidents, unsafe practices and conditions
- Comply with procedures, training, instructions and lifesaving rules.

Kerry Ellem,
General Manager
9 January 2017
HFM (NZ) ENVIRONMENTAL POLICY

Our Commitment
Hancock Forest Management (NZ) Ltd is committed to maintaining a high standard of environmental performance in all of our operations and activities. We will give environmental considerations equal status with the company’s primary business objectives.

Awareness
We will encourage a high degree of environmental awareness through:
- Training
- Personal Accountability
- Commitment
- Continuous Performance Improvement
- Teamwork

Operations
We will operate our business so that we meet or exceed statutory environmental requirements, relevant Codes of Practice, industry best practice guidelines and the requirements of our property management agreements and HSE Charters. We will establish standards or protocols where they are known to not presently exist.

Best Practices
We will develop and implement best management practices where appropriate. In particular:
- To identify, control and monitor environmental hazards.
- To avoid, reduce or control waste and pollutants.
- To manage the natural and physical resources under our control in a sustainable manner and to adopt practices which use energy effectively.

Training
We are committed to training managers and employees, and require our contractors to undertake training, so as to ensure that all individuals working on behalf of Hancock Forest Management (NZ) Ltd are competent in meeting the company’s environmental standards.

Continuous Improvement
We will actively monitor, audit and review procedures, processes and management systems, including objectives and targets, to ensure continuous improvement in environmental performance.

Planning
We will consider effects on the environment in planning all operations and any new developments, products and services.

Responsibility & Compliance
Responsibility for application of this policy and compliance with the company’s environmental standards, lies with all company personnel, contractors and any other party working on behalf of Hancock Forest Management (NZ) Ltd.

<tr>
<td>Houpoto Swamp</td>
<td>Houpoto</td>
<td>HCV1: Recommended Area for Protection. Mapped as part of national wetland study by Landcare Research. Listed by Bay of Plenty Regional Council in their High Value Ecological Sites list (HVES 119), and identified in the list as a site of national significance (Site SVHZ-181).</td>
<td>Initial plant pest control completed targeting willow and pampas. Currently consulting with landowners (Houpoto Te Pua Lands Trust) regarding future management requirements. Carry out plant pest control as required.</td>
</tr>
<tr>
<td>Rawea Terrace/swamp</td>
<td>Torere</td>
<td>HCV3: Landcare Research National wetland survey indicated the wetland is one of the highest scoring wetlands in the EBOP region (21 out of 25 points). Recommended Area for Protection. Listed by Bay of Plenty Regional Council in the High Value Ecological Sites list (HVES 119). Currently listed as regionally significant however following a site visit BOPRC ecologists have confirmed the site has nationally significant ecological values and will be added to the list.</td>
<td>Finalise the management plan in consultation with Torere 64 landowners and BOPRC.</td>
</tr>
</tbody>
</table>

Notes:
1. Management Plans for individual sites are available to interested parties on request from HFM NZ
2. Further sites have been identified as potential or proposed HCVF sites pending further discussion with Department of Conservation, Regional Councils and landowners. These will be added to the list as confirmed.
APPENDIX IV: Key Parties Consulted in Identification of High Conservation Value Areas in the HFM NZ Managed Estate

Department of Conservation Staff

- Wendy Holland, Technical Support Officer, Plants, Northland Conservancy
- Jeff Hall, Technical Support Officer, Northland Conservancy, Kauri Coast Office
- Dave Havell, Technical Support Officer Auckland Conservancy
- Hemi Barsdell, Technical Support Officer, East Coast/Bay of Plenty Conservancy, Opotiki
- Chris Ward, Scientist Gisborne-East Coast Conservancy
- Dave Smith, Technical Support Office, Maniapoto Conservancy, Te Kuiti
- Paul Cashmore, Technical Support Officer, (Plants) Rotorua Lakes Conservancy
- Nick Singers, Technical Support Officer, Tongariro Taupo Conservancy

Regional Councils

- Northland Regional Council – Lisa Forester, Biodiversity Specialist
- Environment Bay of Plenty – Nancy Willems and Annabel Beattie, Scientist
- Environment Waikato – Judy van Rossem and Catherine Beard, Ecologist
- Horizons Regional Council - James Lambie, Scientist

Tangata whenua

- Ngati Whatua o Kaipara
- Raukawa Charitable Trust
- Torere 64
- Houpoto Te Pua lands Trust
- Ngatihine Forest Trust
- Parengarenga Inc

Other

- Willie Shaw and Sarah Beadel, Senior Ecologists, Wildland Consultants
- Chris Ecroyd, Scion
- NZ Institute of Forestry
- Kinleith Consultative Group (community forum)
- Northland Consultative Group (community forum)
